# 2. Application

Data1 : mnist data

https://github.com/jlmelville/mnist

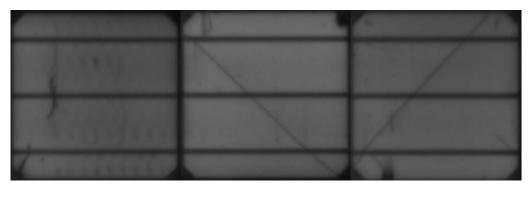

grayscale의 28\*28 data (60000개 - training data, 10000개 - test data)

## 이미지 데이터를 불러와 70000\*784 matrix로 변환하여 진행

Data2: 태양 전지 결함 데이터 – 전기 발광 이미지 (Visual Identification of Defective Solar Cells in Electroluminescence Imagery)

https://github.com/zae-bayern/elpv-dataset : 300\*300, n=2624

cell0001.png cell0002.png cell0003.png

#### labels.csv

attribute	Description
Image url	이미지 저장 이름
Defect probability	결함 확률(0, 0.33333, 0.66666, 1)
	1로 가까워질수록 결함이 있는 태양 전지이다.
Solar module type	태양 전지의 종류(mono/poly)
	Mono: 단일 실리콘 결정으로 만들어진 검은색
	태양전지를 가지고 있으며, 일반적으로 효율이
	더 높다. 가격이 비싸다.
	Poly: 여러 개의 실리콘 결정으로 만들어지며
	파란색 셀을 가지고 있다. 효율은 다소 떨어지
	지만 가격이 저렴하다.
